

ANNEX TO THE PROJECT FOR THE CASE OF A PANDEMIC

FOR THE SAKE OF LIFE ON EARTH

Taking into account the full autonomy of the skyscraper building as designed, in the event of possible further pandemics, the projects provides for the following:

1. FULL ISOLATION of service personnel 1200-1300 people (given the total planting area of the greenhouse-skyscraper to be 50 hectares) from direct contact with the population for the period of quarantine. The engineered autonomy of the skyscraper and the living conditions of the personnel in the building will ensure control over the work of ALDOENERGOMODUL, continuous care for the plants development, fruiting and the provision of vegetable and fruit products to the customers.

2. The sale of products in the Eco-supermarket (1st floor of the building) is projected to be carried out without sellers with the help of an operator at a video surveillance console, robotic equipment and payment for the purchased products via an ATM. Wholesales of products are carried out in the same way.

3. The project provides for development and fruiting of plant products for continuous 5 and more years. In the event of the food supplies exhaustion (canned products - meat, fats, cereals, powdered and condensed milk, etc.), the staff is forced to switch to a vegetarian lifestyle until the end of any quarantine period.

4. At the end of the working day and automatic human-less sale of products in the trading floor of the Eco-supermarket, the premises are disinfected with disinfectants for the night period. In the morning before the opening of the store, the sales area is cleaned, eliminating the remains of disinfectant solution by the cleaners dressed in special infection protection suits.

5. In accordance with the project concept, the full autonomy of a greenhouse-skyscraper means the following:

5.1 Industrial recuperator for supply and exhaust ventilation that provides vital functions for both plants and service personnel with clean air intake from a maximum height of the skyscraper of 500 m.

5.2 Water supply from own artesian wells.

5.3 Independently generated electricity with powerful energy storage systems.

This project is the only one in the world that, in the event of any threat to human life, including pandemics, is able to systematically supply the population with vitamin plant products to maintain human Health and vital functions. The daily provision of residents of megalopolises with fresh vegetable and fruit/berry products will certainly affect the improvement of their Health by enhancing the protective properties of the body against various viral epidemics.

THE AUTHOR'S SUMMARY OF THE ADDITION TO THE PROJECT

The proposed addition to the project cannot leave indifferent a forward-thinking person who holds a position of resolving real problems associated with the pandemic, which today poses an unpredictable in terms of its extent threat to humanity.

After all, today there is no similar project in the world, which in the event of another pandemic is capable to provide population with pollutant-free, freshly grown vegetables and fruit-bearing products for a long time in any period of the year. Without plant products a person is doomed to face the decrease of body protective functions, opening a free path for infections to damage internal organs and body systems. The stage of defeat that occurs in the human body carries irreversible consequences, so the chances of recovery are practically absent.

It should be also remembered that in such situation vitamin or vitamin-like pharmaceutical preparations are unable to substitute freshly grown vitamin-containing products!

I regret that today very many do not understand this...

We are understood and in turn we share the opinion of the world's leading virologists, but, unfortunately, today they CANNOT give an answer to 2 extremely important questions:

1. Is the world ready to clamp down on the next pandemics?

2. Are there in the world today any food or agricultural projects that under conditions of complete autonomy and the most severe quarantine provide for sustainable and uninterrupted food production, constantly providing the population with a healthy diet during the quarantine period?

It is for this purpose that within the proposed project HEALTH FARM - GREEN SKYSCRAPER, we additionally develop a project for a livestock complex for the production of milk, dairy products and high-quality natural cheeses on the first 60 floors of the building, the remaining 40 floors are occupied by a fruits and vegetables growing project.

The level of consumption of dairy products per capita in the world is one of the highest, second only to fruits and vegetables. Dairy and fruit and vegetable products are recognized all over the world as the dominant foods in the healthy diet, strengthening the protective functions of the body. Taking into account epidemics, these are products of primary importance!

It should be noted that the dairy cows housing, compared to the cultivation of fruit and vegetable products is carried out under natural light conditions, therefore the power consumption is significantly reduced, which is fully compensated by the "ENERGOMODULE" generating device.

The project author and initiator,

Anatoliy Aldokimov
